Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in

the application:

1. (Original) A method for operating a hybrid electric vehicle (HEV) having a

low voltage bus, a high voltage bus, and a DC convertor electrically coupling the low and high

voltage busses, the method comprising:

controllably transferring energy from the high voltage bus to the low voltage

bus during prestart of the high voltage bus by controlling energy flow through the DC/DC

converter.

2. (Original) The method of claim 1 further comprising determining a battery

energy level of a high voltage battery coupled to the high voltage bus, the high voltage battery

for storing electric energy for use in precharging the high voltage bus, controllably transferring

energy to the low voltage bus from the energy provided to the high voltage bus by the high

voltage battery if the battery energy level is greater than a predefined energy level.

3. (Original) The method of claim 2 further comprising determining a battery

state of charge for the high voltage battery, the battery energy equaling the battery state of

charge.

4. (Original) The method of claim 3 further comprising determining a battery

power discharge limit for the high voltage battery, the battery energy equaling the battery

power discharge limit.

5. (Original) The method of claim 2 further comprising determining whether

the high voltage battery energy is sufficient for powering an electric starter used for starting

the vehicle, transferring energy to the low voltage bus only if the high voltage battery energy

is sufficient for power the electric starter.

6. (Original) The method of claim 5 further comprising continuously monitoring the battery energy, preventing further transfer of energy to the low voltage bus if the battery energy drops below a predefined energy threshold, the predefined threshold being greater than the energy needed for starting the electric starter.

- 7. (Original) The method of claim 2 further comprising determining precharging by sensing an ignition key turned to a run position, determining prestart by closing opened contactors coupled between the high voltage battery and the high voltage bus once the high voltage bus is charged, and transferring energy to the low voltage bus only if the contactors are closed.
- 8. (Original) The method of claim 1 further comprising determining a battery voltage of a low voltage battery coupled to the low voltage bus, controllably transferring energy to the low voltage bus based on the battery voltage of the low voltage battery.
- 9. (Original) The method of claim 8 further comprising limiting energy transfer to the low voltage bus if the battery voltage of the low voltage battery is greater than a predefined voltage.
- 10. (Original) A vehicle system controller for operating a hybrid electric vehicle (HEV) having a low voltage bus for providing power to accessory loads and a high voltage bus electrically coupled to the low voltage bus by a DC/DC converter, the high voltage bus providing power for electric driving of the vehicle, the controller comprising:

means for controllably transferring energy from the high voltage bus to the low voltage bus during prestart of the high voltage bus by controlling energy flow through the DC/DC converter.

11. (Original) The controller of claim 10 wherein the controller further comprises means for determining a battery energy level of a high voltage battery coupled to the high voltage bus and controllably transferring energy to the low voltage bus from the

energy provided to the high voltage bus by the high voltage battery if the battery energy level

is greater than a predefined energy level.

12. (Original) The controller of claim 11 wherein the controller further

comprises means for determining a battery state of charge for the high voltage battery, the

battery energy level equaling the battery state of charge.

13. (Original) The controller of claim 11 wherein the controller further

comprises means for determining a battery power discharge limit for the high voltage battery,

the battery energy level equaling the battery power discharge limit.

14. (Original) The controller of claim 11 wherein the controller further

comprises means for determining whether the battery energy is sufficient for powering an

electric starter used for starting the vehicle and transferring energy to the low voltage bus only

if the battery energy level is sufficient to power a electric starter.

15. (Original) The controller of claim 14 wherein the controller further

comprises means for continuously monitoring the battery energy and preventing further

transfer of energy to the low voltage bus if the battery energy drops below a predefined energy

threshold.

16. (Original) The controller of claim 11 wherein the controller further

comprises means for determining prestart by sensing closing of opened contactors coupled

between the high voltage battery and the high voltage bus once the high voltage bus is charged

and transferring energy to the low voltage bus only if the contactors are closed.

17. (Original) The controller of claim 10 wherein the controller further

comprises means for determining a battery voltage of a low voltage battery coupled to the low

voltage bus and controllably transferring energy to the low voltage bus based on the battery

voltage of the low voltage battery.

18. (Original) The controller of claim 17 wherein the controller further comprises means for limiting energy transfer to the low voltage bus if the battery voltage of the low voltage battery is greater than a predefined voltage.

19. (Original) A hybrid electric vehicle system, the system comprising:

an internal combustion engine;

a generator/motor for electrically starting the internal combustion engine;

a high voltage battery for storing high voltage energy;

a high voltage bus coupled between the generator/motor and the high voltage

battery;

contactors coupled between the high voltage battery and the high voltage bus to electrically isolate the high voltage battery from the high voltage bus when opened;

a precharging device for precharging the high voltage bus prior to closing of the opened contactors;

a low voltage battery for storing low voltage energy and powering accessories;

a low voltage bus coupled between the battery and the accessories;

a DC/DC converter coupled between the high voltage bus and the low voltage bus, the DC/DC converter being isolated from the high voltage battery when the contactors are opened; and

a vehicle system controller, the vehicle system controller including instructions for controllably

transferring energy from the high voltage bus to the low voltage bus during prestart of the high voltage bus by controlling energy flow through the DC/DC converter.

- 20. (Original) The system of claim 19 wherein the vehicle system controller further comprises instructions for transferring energy to the low voltage bus only if a high voltage battery energy is sufficient for powering the generator/motor for starting the engine.
- 21. (New) The method of claim 1 further comprising performing the prestart prior to controlling energy transfer from the high voltage bus to the low voltage bus, the

prestart including discharging a high voltage energy storage source to the high voltage bus prior to closing contactors used to electrically connect the high voltage energy storage source to an electrically operable drive element used to drive the vehicle.

22. (New) The method of claim 21further comprising operating a precharging device to precharge the high voltage bus and to transfer energy to the low voltage bus prior to closing the contactors.
